

— CONCEPTUAL FRAMEWORK

DAILY PROFILES.

Session-based delivery templates. How the algorithm engineers Asia, London, and New York into predictable, fractal liquidity behavior.

A ZM CAPITALS REFERENCE

— 00 / FOUNDATION

WHAT PROFILES ARE.

Narrative models, not signals. Templates, not entries.

Daily Profiles are session-based delivery templates that describe how price moves within a single trading day. They map **Asia** → **London** → **New York** into predictable liquidity-engineering behaviors.

THEIR PURPOSE

- To classify the **type of day**
- To understand where the **trap** is
- To forecast which session controls **delivery**
- To anticipate which **liquidity** will be targeted

— CRITICAL DISTINCTION

Daily Profiles are NOT signals. NOT strategies. NOT entries. They are pure narrative models — frameworks for reading the algorithm's intent across the day.

THE THREE QUESTIONS EVERY PROFILE ANSWERS

- **Where was liquidity accumulated?** — typically Asia, the accumulation zone.
- **Where was liquidity manipulated?** — either London or NY, depending on profile.
- **Which session performs true distribution?** — the opposite of the manipulation session.

This is the real utility of Daily Profiles: they reveal the inter-session flow of **Power of Three** — accumulation, manipulation, distribution — applied not to a single candle, but to the full trading day.

— 01 / PROFILE ONE

LONDON MANIP. NY DISTRIBUTION.

The foundational daily profile. Most common in algorithmic delivery.

STRUCTURE

- Asia forms a **stable, narrow range**.
- London **violates one side** of that range — high or low.
- New York completes delivery by **attacking the opposite side**.

ASIA → LONDON SWEEP → NY DELIVERY

E = Liquidity **C** = Displacement

— FIG 01 · SELLSIDE SWEEP, PREMIUM DISTRIBUTION

01 CONCEPTUAL LOGIC

London represents the manipulation phase — a deliberate expansion beyond Asia's liquidity to create an artificial directional bias. Retail enters the London move thinking it's "the trend." It isn't. It's the trap.

New York represents the distribution phase — the true delivery of the daily candle, using the liquidity that London engineered. The algorithm inverts on the opposite side and walks price toward the real target.

— THE MECHANISM

London provides the **wick** of the daily structure. New York provides the **body**. Asia is the engineered liquidity pool that fuels both.

▪ WHAT THIS PROFILE TEACHES

- Multi-session displacement is **fractal Power of Three** — Asia = A, London = M, NY = D.
- London provides the **wick** of the daily candle.
- New York provides the **body** of the daily candle.
- Asia's range functions as **engineered liquidity**.
- This is the foundational profile — the most common in algorithmic delivery.

READING THE DAY

When Asia consolidates tightly and London opens with aggressive expansion through one side, your bias should immediately tilt toward this profile. The opposite side of Asia's range becomes the true target — not the side London violated.

Recognise the trap and you recognise the day.

— 02 / PROFILE TWO

NY MANIPULATION + CONTINUATION.

Single-session PO3, localized inside New York.

STRUCTURE

- Asia and London form a **shared consolidation** — coiled liquidity.
- New York **sweeps one side** of this combined range.
- Instead of reversing, price **continues in the same direction** after the sweep.

ASIA + LONDON → NY SWEEP → NY EXPANSION

— FIG 02 · COILED ASIA + LONDON, NY EXPANSION

02 CONCEPTUAL LOGIC

This is the profile where **manipulation and distribution both occur in New York** — but as two separate legs.

- **NY sweep** = manipulation
- **NY expansion** = distribution

Asia and London quietly accumulate in a tight, coiled range. The first two sessions store energy. New York is the central point of intent — it executes both halves of the day's narrative in a single window.

— CRITICAL INSIGHT

The sweep does not signal reversal. It is **fuel for continuation**. The algorithm has chosen a trend day, not a reversal day — and it has localized the entire PO3 inside NY.

• WHAT THIS PROFILE TEACHES

- Consolidation across the first two sessions indicates **energy storage**.
- NY becomes the central point of **intent**.
- The sweep does not signal reversal — it provides **liquidity for continuation**.
- This is the algorithm choosing a **trend day**, not a reversal day.
- Fundamentally a **single-session PO3**, localized inside NY.

HOW TO READ THE SETUP

The tell is the consolidation. When Asia and London both refuse to expand — when the entire pre-NY session looks like it's drawing breath — the algorithm is preparing for a single dominant directional move. The sweep that opens NY is the entry mechanism, not the climax. It engineers the liquidity that the expansion will use as runway.

Treat the sweep as the start of the move, not the end of it.

— 03 / PROFILE THREE

THE DEATH PROFILE.

The clearest expression of unidirectional bearish control.

STRUCTURE

- Each new session **fails to exceed** the previous session's high.
- Each new session **does break** the previous session's low.
- Day forms **lower highs and lower lows**, session by session.

ASIA → LONDON LL → NY LL

— FIG 03 · LOWER HIGHS, LOWER LOWS — SESSION BY SESSION

03 CONCEPTUAL LOGIC

The Death Profile is the clearest expression of:

- **Daily bearish control**
- **Systematic sell-side delivery**
- **A unidirectional liquidity algorithm**

Every session is doing the same thing — refusing to take buy-side liquidity and continuously targeting sell-side liquidity. There is no rotation. There is no manipulation phase to flip the day. The algorithm has chosen its direction and is compressing premium → discount across every session.

— DAILY CANDLE FORM

The daily candle in a Death Profile is almost always an **OHLC structure** — Open near High, Close near Low. Pure bearish daily delivery.

• WHAT THIS PROFILE TEACHES

- The daily candle is almost always an **OHLC structure** (bearish daily formation).
- There is **no manipulation for reversal** — every sweep is continuation-based.
- The algorithm is **compressing premium** → **discount** all day long.
- This is the strongest bearish form of intraday delivery.
- The negative version of a Trend Profile.

READING THE DAY

The Death Profile is unforgiving for counter-trend reads. Every push back into premium can look like the start of a reversal — but in this profile, none of them are. Each push back up is engineered fuel for the next leg of sell-side delivery. The narrative is one-directional, all day.

Recognising the profile early is what protects you from fading it.

— 04 / PROFILE FOUR

THE TREND PROFILE.

The purest form of bullish algorithmic delivery.

STRUCTURE

- Each new session **fails to take** the previous session's low.
- Each new session **does take** the previous session's high.
- Day forms **higher highs and higher lows** all day.

ASIA → LONDON HH → NY HH

— FIG 04 · HIGHER HIGHS, HIGHER LOWS — SESSION BY SESSION

04 CONCEPTUAL LOGIC

The Trend Profile displays:

- **Daily bullish control**
- **Unidirectional displacement**
- **Accumulation → expansion across the entire day**

Instead of manipulation → reversal, the day consists of **minor consolidations → expansions → consolidations → expansions**. Each pause is a re-accumulation. Each expansion is a continuation. Sell-side liquidity is respected at every turn — it's the foundation the algorithm is using to build the trend.

— DAILY CANDLE FORM

The daily candle in a Trend Profile is almost always an **OLHC structure** — Open near Low, Close near High. Pure bullish daily delivery.

• WHAT THIS PROFILE TEACHES

- The daily candle is almost always an **OLHC structure** (bullish daily formation).
- **No true downside manipulation** occurs — price respects sell-side.
- The algorithm is **rebalancing discount → premium** every session.
- This is the purest form of bullish algorithmic delivery.
- The positive version of a Death Profile.

READING THE DAY

On a Trend Profile, every session pullback holds. The market is not asking permission — it's executing. Counter-trend reads don't survive long; the unidirectional flow asserts itself quickly. The narrative is buy-side delivery, all day, with re-accumulation pauses between expansions.

Recognising the profile early is what protects you from fading it.

— 05 / SYNTHESIS

THE PURPOSE OF PROFILES.

Reading the algorithm's intent across the day.

Daily Profiles reveal the **type of day** the algorithm is engineering. They are not predictions — they are recognitions.

EACH PROFILE ANSWERS THREE QUESTIONS

QUESTION	ANSWER
Where was liquidity accumulated?	Asia — the accumulation zone
Where was liquidity manipulated?	London or NY (depending on profile)
Which session distributes?	NY or London (depending on profile)

WHY IT MATTERS BEYOND BIAS

PROFILE	ALGORITHMIC INTENT
London Manip → NY Distribution	Algorithm wants a reversal day
NY Manip + Continuation	Algorithm wants a trend day from NY
Death Profile	Algorithm wants aggressive sell-side efficiency
Trend Profile	Algorithm wants aggressive buy-side efficiency

— CORE TRUTH

The market is not random. These are session-based delivery patterns — the algorithm's signature, repeated across instruments and across years.

— 06 / RELATIONSHIPS

CROSS-PROFILE LOGIC.

How the four profiles connect to a single underlying truth.

POWER OF THREE FRACTALIZATION

All daily profiles are fractal variations of **accumulation** → **manipulation** → **distribution** applied across sessions. The unit changes — sometimes it's the full day, sometimes a single session — but the algorithm is the same.

DAILY CANDLE STRUCTURE

PROFILE	DAILY CANDLE FORM
Death Profile	OHLC (pure bearish)
Trend Profile	OLHC (pure bullish)
London Manip → NY Distribution	Hybrid (wick + body across sessions)
NY Manip + Continuation	Hybrid (PO3 localized in NY)

LIQUIDITY HIERARCHY

Every profile expresses the same theme:

ENGINEERED LIQUIDITY → LIQUIDITY RAID → TARGET LIQUIDITY

What changes is **which session does what**. Identify the role each session plays, and you've identified the profile. Identify the profile, and you've identified the day.

— FINAL SYNTHESIS

Four profiles. One algorithm. Every day is a variation of the same structure — accumulation, manipulation, distribution — distributed across Asia, London, and New York. Read the distribution, and you read the day.

The market is not random.
These are **session-based**
delivery patterns.
